Datum: 3. Oktober 2018

Vorwort: Die hier aufgeführte erkrankungsspezifische Medizinstudienliste ist nur zur Prävention oder einer raschen Regeneration nach starken körperlichen Belastungen (Leistungs- und Breitensport) angegeben. Sie ist keine Anleitung oder Aufforderung zur Eigentherapie. Sollten Sie an einer Erkrankung leiden, ist dafür alleine der sie behandelnde Arzt oder Therapeut Ihrer Wahl zuständig!

Es gibt das Internetportal **Medizin-Transparent**, das nach den Richtlinien der Evidenzbasierten Medizin (EbM) eine Bewertung von Medizinstudien vornimmt.

Die Bewertung dieser Studienliste durch Medizin-Transparent, können Sie hier einsehen: <https://www.medizin-transparent.at/bienen-krebs>

Auszug aus dieser Bewertung:

Hoffnung bisher nur im Reagenzglas

Bislang wurde nur an Versuchstieren und Krebszellen im Reagenzglas untersucht, ob Produkte von Bienen möglicherweise gegen Krebs wirken könnten. Einige dieser Experimente liefern Hinweise, dass Propolis, Gelee Royale oder Bienengift Krebszellen am Wachstum, oder der Ausbreitung hindern oder sie gar abtöten können [8, 9].

Allerdings bleibt fraglich, ob diese Produkte auch im menschlichen Körper gegen Krebs wirken. Für einen derartigen Nachweis wären gut durchgeführte klinische Studien mit menschlichen Patienten notwendig. Solche Untersuchungen sind aber derzeit Mangelware. Ob Produkte von Bienen einen Beitrag in der Krebstherapie leisten können, lässt sich daher derzeit nicht sagen.

Unterstützung bei Strahlentherapie

Wir konnten jedoch einige Studien finden, die untersucht haben, ob Produkte von Bienen die Nebenwirkungen von Chemo- und Strahlentherapien mildern können. Das Problem dieser Krebsbehandlungen ist, dass sie nicht nur die sich schnell vermehrenden Krebszellen angreifen, sondern auch gesunde, sich rasch teilende Körperzellen wie die Zellen der Mundschleimhaut schädigen. Das führt dazu, dass viele

Patienten mit Tumoren im Kopf- oder Halsbereich während einer solchen Behandlung mit einer schmerhaften Entzündung der Mundschleimhaut zu kämpfen haben. Im schlimmsten Fall machen die dadurch verursachten Schmerzen Essen und Trinken unmöglich und die Betroffenen verlieren viel Gewicht [1] [13]. Die Behandlung einer solchen Entzündung ist schwierig und langwierig. Neben einer gezielten Mundpflege, verschiedenen Mundspülösungen und Medikamenten verwenden manche Betroffenen auch Honig.

Kommentar vom Autor von www.bienen-zur-gesundheit.de:

Es liegt noch viel Arbeit vor uns, diese Studien nach den strengen Richtlinien der EbM durchzuführen: <http://www.cochrane.de/de/ebm>

Ich werde mir in den nächsten Monaten die Fortschritte der modernen Onkologie zum Stand von 2004 ansehen. **Giftkur ohne Nutzen!** Der Spiegel 2004.

Ich möchte endlich die umfangreichen placebokontrollierten Studien sehen, die beweisen, dass Chemotherapie zur Heilung von Tumorerkrankungen einen wesentlichen Beitrag erbringt.

Zudem verstehe ich nicht, dass das giftige Glyphosat nur mit manipulierten Tierstudienergebnissen (20 Ratten über 90 Tage; ab 120 Tage beginnt die Tumorbildung) für die Nahrungskette von Menschen freigegeben wurde, wenn man anhand von Tierstudien angeblich keine Rückschlüsse auf den menschlichen Organismus ziehen kann! (Das BfR lügt!)

Personen aus Österreich können hier kostenlos Fragen zu Gesundheitsthemen stellen. Bitte verwenden Sie diese Chance nicht für Fragen wie: Helfen Hobelsspäne gegen Karies. Die Zeit deren Mitarbeiter ist kostbar, die Anfragenliste ist lang und viele von Krankheiten geplagte Mitbürger suchen ebenfalls verzweifelt nach einer Lösung für sich. Sie können auch Fragen zu Studien stellen oder sie zur Bewertung einschicken. Nehmen Sie die Möglichkeit wahr und informieren Sie sich bitte vorher über diese Themen und die Qualität von Standards zu Medizinstudien auf <http://www.cochrane.de/de/ebm>. Ich habe mir als medizinischer Laie, zum Einstieg in das Thema das Buch Epidemiologie für Dummies besorgt.

Die nun folgende Liste wird regelmäßig um weitere Studien ergänzt und entspricht damit nicht mehr dem ursprünglich eingereichten Umfang!

Medizinische Bienenproduktstudien zu verschiedenen Krebsarten (diese Liste wird ständig um aktuelle Studien ergänzt)

BG = Bienengift, PP = Propolis, GR = Geleé Royal, H = Honig, BP = Bienenpollen

Allein auf PubMed findet man über 3000 Studien zu Propolis und Krebs...

Die Studien sind zur eigenen Recherche angegeben. Eine qualitative medizinische Bewertung nach den Richtlinien der EBM http://flexikon.doccheck.com/de/Evidenzbasierte_Medizin wird vom Autor nicht vorgenommen. Dazu lesen sie bitte die Bewertung auf: <https://www.medizin-transparent.at/bienen-krebs>
